

RADIOLOGY EXAMINATION REPORT

Patient Name : Maha Abdul Hadi
MRN : 10251197 Age/Sex : 31Y/F
Requested By : Dr. Abdul Jabbar Procedure Date : 20-06-2026 11:11:39
Facility : MEDCARE HOSPITAL

ULTRASOUND THYROID

CLINICAL INDICATION: For evaluation of diffuse thyroid disease.

FINDINGS:

- Both lobes of the thyroid are normal in size, show diffusely heterogenous echotexture with pseudonodular appearance and raised vascularity in both lobes. Nodule assessment is suboptimal in the presence of diffuse pseudo nodularity, however there is no obvious evidence of solid hypoechoic nodule with microcalcifications.
- Few small volume bilateral submandibular and level II/level III lymph nodes are seen, some of which appear hypoechoic. Largest of these measure approximately 4 x 11 mm in right level 2.
- Great vessels of neck appear normal.

IMPRESSION:

- Imaging features are suggestive of diffuse thyroid disease, possibly inflammatory/autoimmune thyroiditis. Suggested clinical and TFT correlation.

Disclaimer: Please note that this report has been generated using speech recognition software and may contain errors related to system software including errors in grammar, punctuation, spellings as well as words and phrases. If there are any questions or concerns, please feel free to contact the reporting radiologist for clarification.
