

Patient ID	10825562	Patient Name	Musarat Hussain Javed Nasir
Age / Gender	38Y 1M / Female	Referring Physician	Dr Hiba Waleed Kashmoola
DOB	1988-05-04	Procedure	ULTRASOUND THYROID
Study Time	2026-06-20 17:57:21	Reported DateTime	2026-06-21 16:06:49

THYROID ULTRASOUND REPORT

Technique:

Real-time grayscale and color Doppler ultrasound examination of the thyroid gland and adjacent cervical soft tissues was performed.

Findings:

Thyroid Gland:

The thyroid gland is normal in size with homogeneous echotexture and normal vascularity.

Right Thyroid Lobe:

Measures approximately $4.0 \times 1.3 \times 1.3$ cm with an estimated volume of 3.5 mL.

No focal thyroid lesion identified.

Left Thyroid Lobe:

At the lower pole of the left thyroid lobe, there is a predominantly solid echogenic nodule containing a central cystic component, measuring approximately $1.9 \times 1.5 \times 0.97$ cm. The lesion demonstrates prominent peripheral vascularity on color Doppler examination. No calcifications are identified. No evidence of extrathyroidal extension is seen.

Isthmus:

Measures approximately 1.5 mm in thickness. No focal lesion identified.

Cervical Lymph Nodes:

A few mildly enlarged deep cervical lymph nodes are noted bilaterally, maintaining reactive sonographic morphology.

Trachea:

Central in position.

No retrosternal Extension

No extrathyroidal Extension

Submandibular Glands:

Both submandibular glands appear unremarkable.

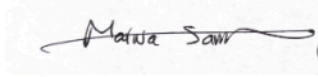

Impression:

- Solitary left lower-pole thyroid nodule predominantly solid, with a central cystic component as described.
- Homogeneous thyroid gland with normal vascularity.
- Few mildly enlarged deep cervical lymph nodes, likely reactive in appearance.

ACR TI-RADS TRII .

Recommendations:

- Clinical and laboratory correlation with thyroid function tests is advised.
- Follow-up thyroid ultrasound.
